INTRODUCTION

Nature in Eurobodalla 38 provides a summary of the status of the fauna of the Eurobodalla Shire compiled from records submitted to the Eurobodalla Natural History Society during 2023. The report is restricted to those species recorded during the year; species not recorded are not listed. An annotated list of all bird species recorded in the Eurobodalla since the inception of the Society in 1986 is available on the Society's website (www.enhs.org.au) and is updated annually to reflect new sightings. A map of the Shire is also available on the Society's website.

2023 was a warm year with the statewide annual mean temperature 1.30°C above the 1961–1990 average, which is the equal sixth-highest on record. In the Eurobodalla, new records were set, or existing records equaled, at Bureau of Meteorology stations for the highest annual mean temperature (Montague Island) and highest annual mean daily maximum temperature (Montagu Island and Narooma). Montague Island and Moruya Airport also had their warmest night (highest daily minimum temperature) on record on 29 January.

Rainfall for the year was lower than average for the Bureau of Meteorology stations along the coast, with 770mm at Moruya Heads (81%) and 861mm at Narooma (93%). In contrast the station at Kiora had 1973mm, its highest total annual rainfall in 29 years of records. As much as 50% of the rain fell in the last 6 weeks of the year, with the highest ever daily rainfalls recorded at two Moruya stations, Burra Creek (225mm) and Kiora (293mm) on 29 and 30 November respectively. November and December were the wettest months, with members recording 285mm at Maulbrooks Rd and 257 at Bergalia in November and 315 at Comerang and 233 at Mystery Bay in December. July was the driest month, with no more than 1mm recorded.

The year provided just one new bird species for the Shire, a pair of Red-whiskered Bulbul (*Pycnonotus jocosus*), presumed to be aviary escapes or releases, reported in Dalmeny and Narooma in November. Two new reptile species were also added to the Society's records; a Common Scaly-foot (*Pygopus lepidopodus*) found at Coila Lake in September and a Burton's Legless Lizard (*Lialis burtonis*) found deceased at Pedro Swamp in November

The seldom recorded Beach Stone-curlew (*Esacus magnirostris*) was reported at Lilli Pilli in August and at South Durras and Brou Lake in October after a 10-year absence from the records. Also returning to the records after a 3-year absence were three species of crake (Ballion's, Spotless and Spotted) all of which were seen at the Batemans Bay Water Gardens in October to December. White-fronted Chat also returned to Coila Lake after a 2-year absence from the records. Missing from the records in 2023 were two species usually recorded, the Swift Parrot and Fairy Martin.

The taxonomic sequence in which the bird species are listed follows the Birdlife Australia Working List of Australian Birds v4 published in December 2022. The taxonomic sequence used for other vertebrate species basically follows Clayton *et al* (2006). Taxonomic references used in compiling this report are listed below. The conservation status ascribed to bird species (Critically Endangered, Endangered and Vulnerable) is that given in Schedule 1 of the NSW Biodiversity Conservation Act, 2016.

Once again, my thanks go to all contributors who have made this report possible. I particularly thank my co-compiler, Julie Morgan, for her work as the Society's Recorder during the year. A complete list of those who have contributed observations during the year appears on the final page.
